DailyOffice · Pack Cam

Pack Cam — Setup Guide

A packing video for every PackStation scan, saved automatically and named by the tracking ID.

1. Packer scans the tracking ID in PackStation → **2. Camera records** the packing table all the time → **3. Office PC cuts** the video from this scan to the next scan → **4. Video saved** as `TRACKING-ID.mp4` on PC / Dropbox / Drive

Before you start, keep ready

☐ The **office Windows PC** that stays on all day (it must be on the same network as the cameras).

☐ Each camera's **IP address** and **password** (your camera installer has these — see Part C).

☐ Your **DailyOffice admin login**.

☐ Nothing to download in advance: the Pack Cam program and this guide are always in DailyOffice → Settings → Pack Cam → **Status & setup**.

☐ About **30 minutes**. You do this **only once**.

Part A — Get your agent key (in DailyOffice) 2

Part B — Set up the office PC 4

Part C — Add your cameras (in DailyOffice) 8

Part D — Choose where videos are saved, then turn Pack Cam on 10

Part E — Check that it works 12

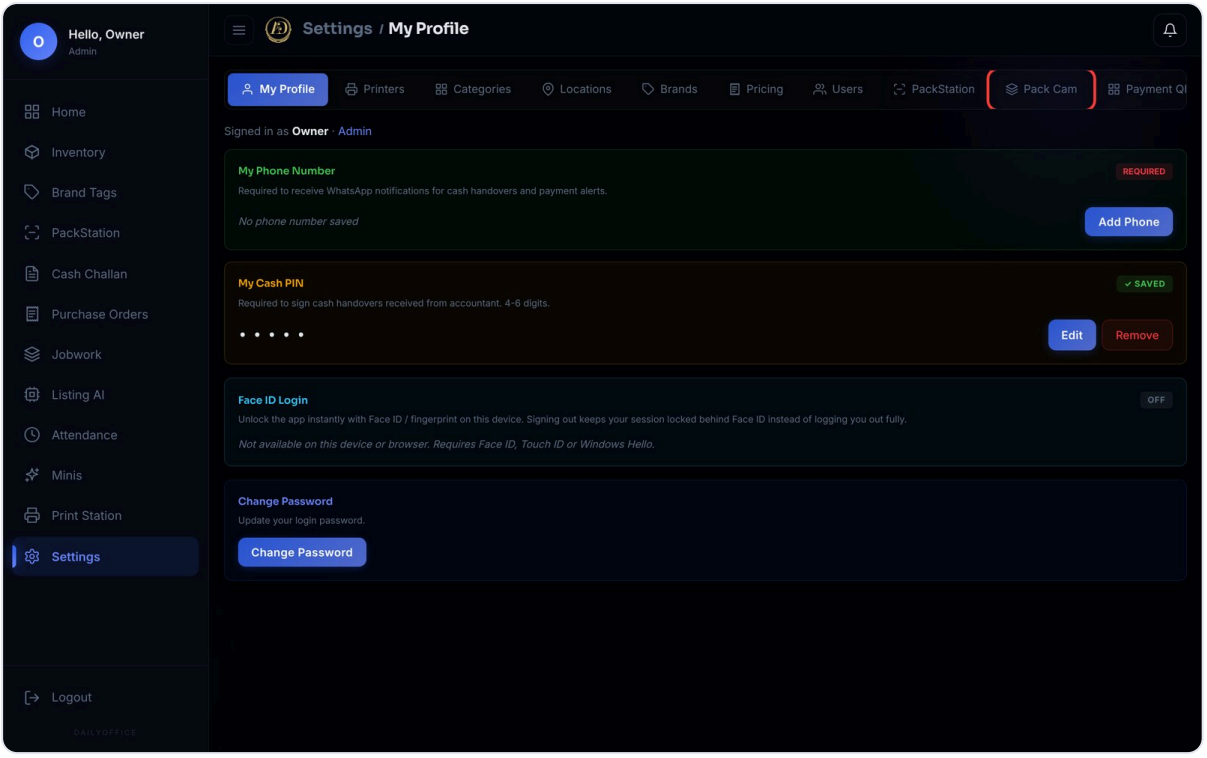

Part F — Daily use, clearing old videos, and problems 15

Part A — Get your agent key

Do this in DailyOffice, on any computer or phone. The "agent key" is a password that lets the office PC talk to DailyOffice.

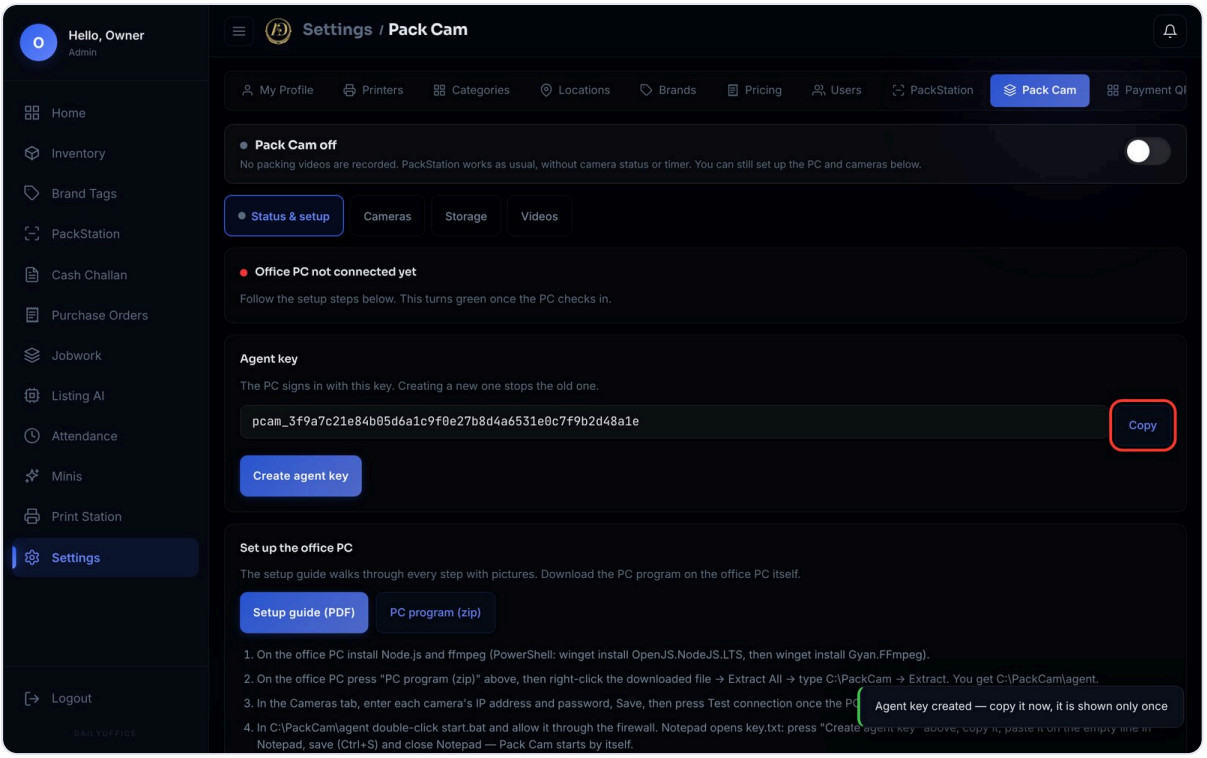

1 Open Settings → Pack Cam

Sign in to DailyOffice as admin. Click **Settings** in the menu, then the **Pack Cam** tab (marked in red).

2 Press "Create agent key", then "Copy"

A long key starting with `pcam_` appears. Press **Copy**. Paste it somewhere safe for now (for example, send it to yourself on WhatsApp) — you will paste it on the office PC in Part B, step 5 (or press Create agent key on the office PC itself at that step).

> **The key is shown only once.** If you lose it, just press "Create agent key" again and use the new one (the old one stops working).

Part B — Set up the office PC

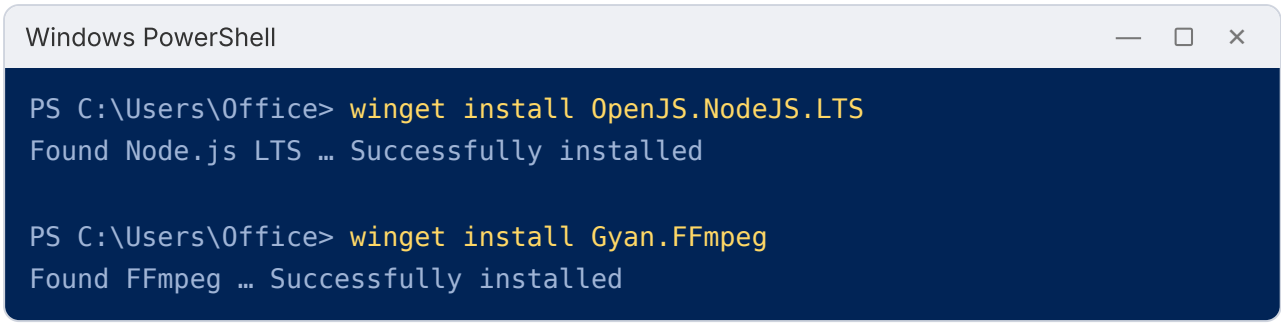

Do every step in this part **on the office PC** (the one that stays on and is on the same network as the cameras).

1 Open PowerShell

Click the **Start** button, type **PowerShell**, and click **Windows PowerShell**. A blue window opens.

2 Install the two programs Pack Cam needs

Type (or copy-paste) these two lines into the blue window, pressing **Enter** after each. Each one takes a minute or two. If it asks *"Do you agree to all the source agreements terms?"* type **Y** and press Enter.

Illustration

- **Node.js** runs the Pack Cam program.
- **FFmpeg** records and cuts the videos.

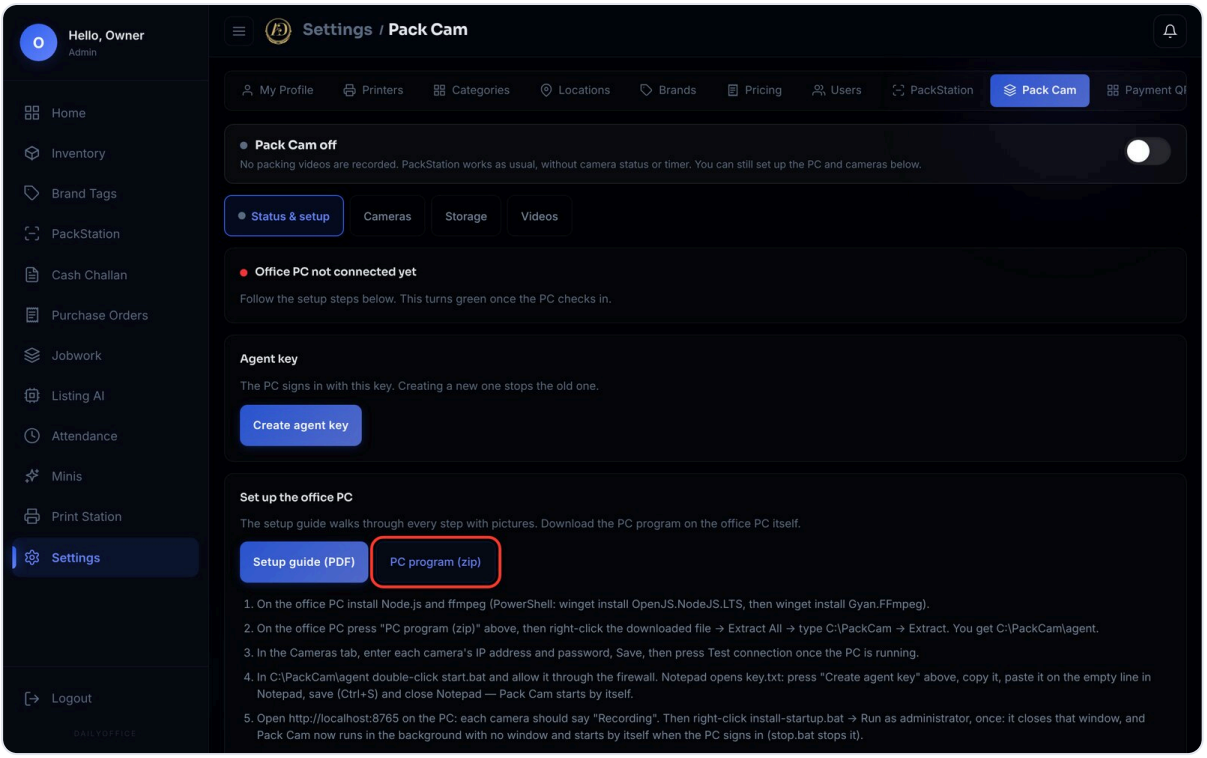

> If PowerShell says *"winget is not recognized"*: install **App Installer** from the Microsoft Store, then try again.

3 Restart the PC once

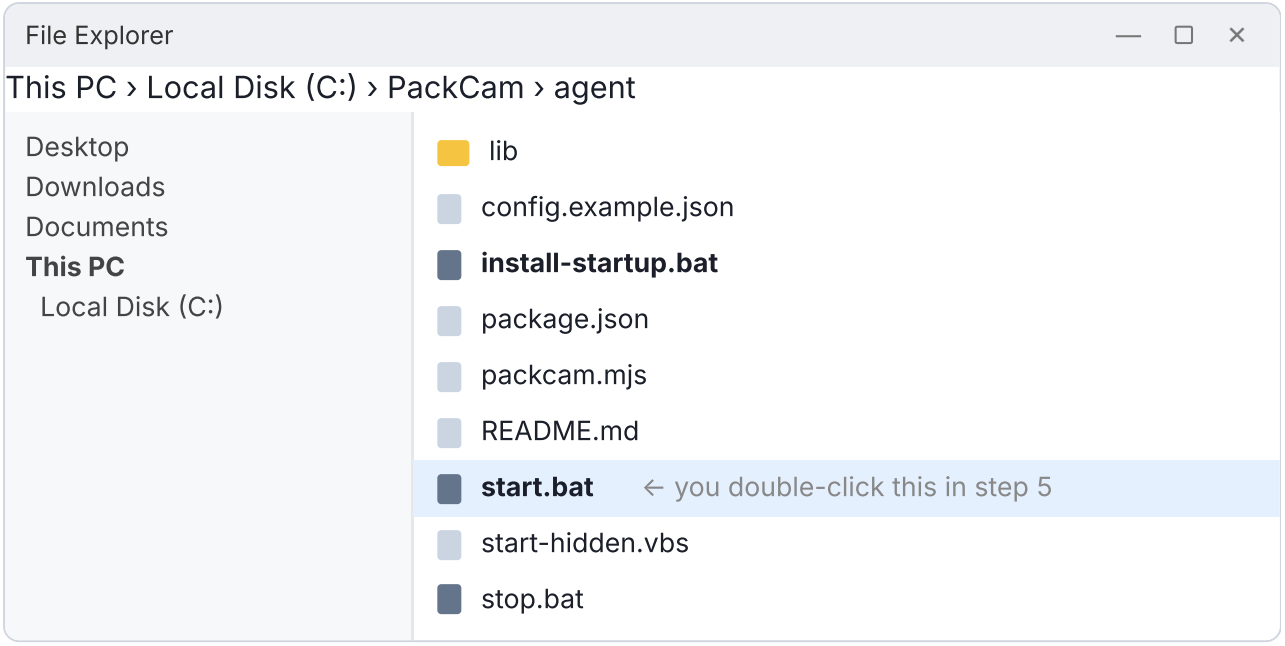

This makes Windows notice the two new programs. After it restarts, continue with step 4.

4 Download the Pack Cam program and unzip it to C:\PackCam

1. On the office PC, open DailyOffice → Settings → Pack Cam → Status & setup and press **PC program (zip)** (see the picture below). The file **PackCam-PC-Setup.zip** goes to your Downloads folder.
2. Right-click it → **Extract All...**
3. In the box, type `C:\PackCam` and press **Extract**.

You now have a folder `C:\PackCam\agent` that looks like this:

Illustration

5 Double-click start.bat and paste your agent key

1. In `C:\PackCam\agent` double-click **start.bat**. A black window titled **Pack Cam** opens; leave it open for now (step 8 closes it and makes Pack Cam run in the background).
2. The first time, **Notepad opens a file called key.txt** by itself. Click on the empty line under the first line and paste your key from Part A (**Ctrl + V**).
3. Press **Ctrl + S** to save, then close Notepad. Pack Cam starts by itself within a few seconds.

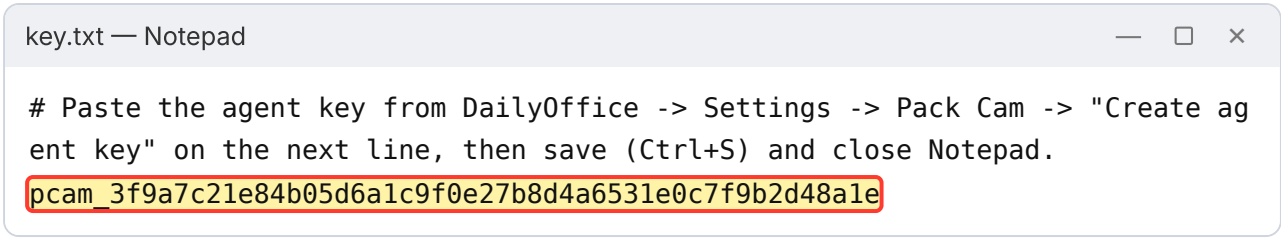

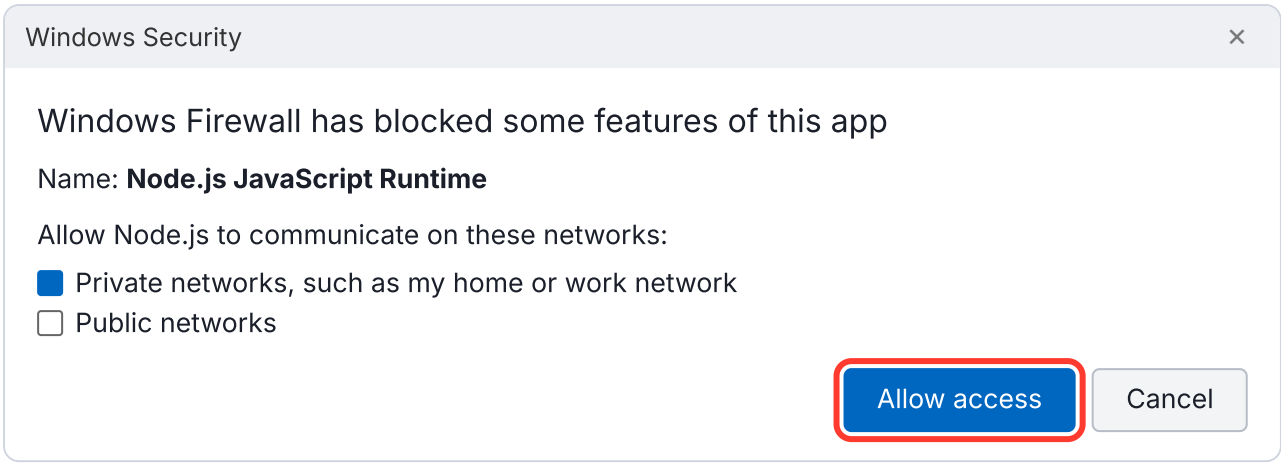

Illustration — your key will be different

> The key is kept in `C:\PackCam\key.txt`, outside the program folder: updating the program later never removes it.

6 Allow Pack Cam through the firewall

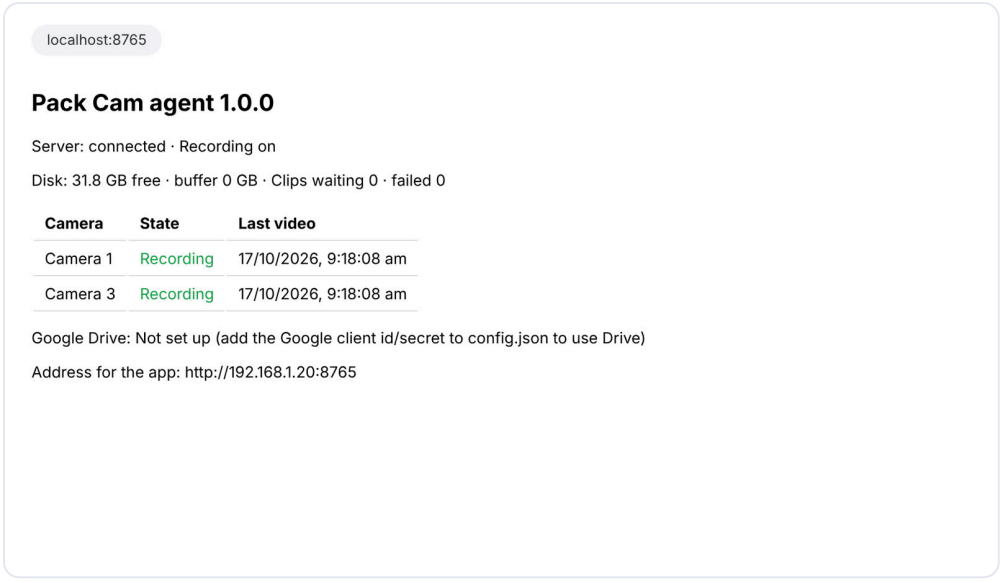

The first time, Windows asks about the firewall — tick **Private networks** and press **Allow**. This lets office phones play videos kept on this PC.

Illustration

7 Check Pack Cam's own page on the PC

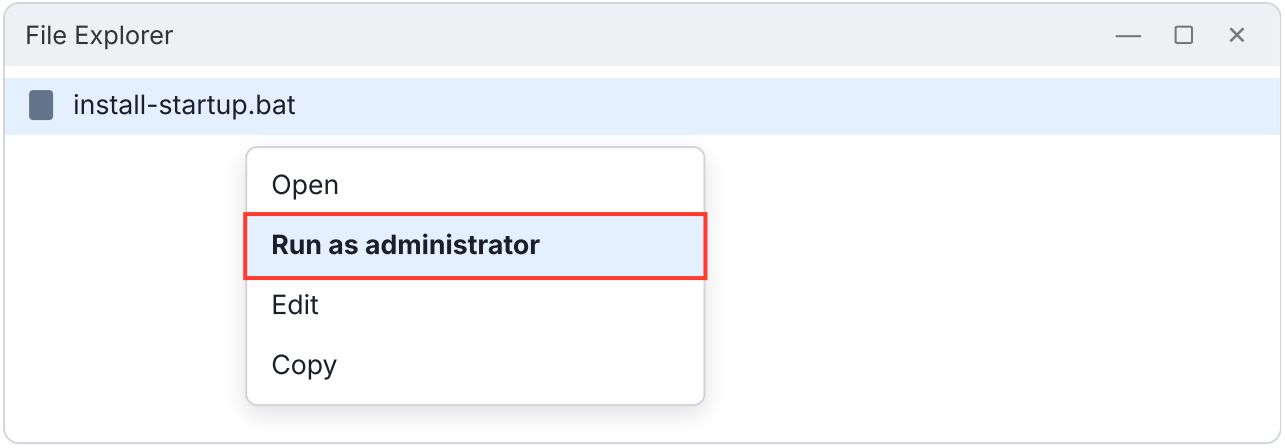

On the office PC, open Chrome or Edge and go to `localhost:8765`. You should see **Server: connected**. The cameras appear here after Part C, and each should say **Recording**.

Pack Cam's page on the office PC (with two cameras added)

8 Make Pack Cam start by itself

In the `C:\PackCam\agent` folder, **right-click install-startup.bat** → **Run as administrator** → **Yes**. It closes the black Pack Cam window by itself, starts Pack Cam in the background and says *"Pack Cam now runs in the background (no window) and starts by itself when you sign in."* Press any key to close. From now on there is no window: Pack Cam runs by itself from the moment the PC signs in. (To stop Pack Cam on purpose, double-click **stop.bat**.)

Illustration

9 Keep the PC awake and signing in by itself

Pack Cam only records while the PC is on and signed in.

- **Never sleep:** Start → Settings → System → **Power** (or Power & sleep) → set **Sleep** to **Never**.
- **Sign in automatically after a power cut:** press **Windows + R**, type `netplwiz`, press Enter. Untick *"Users must enter a user name and password to use this computer"* → OK → type the Windows password twice.

> If you cannot see that tick box in netplwiz, ask whoever looks after your computers to turn on automatic sign-in.

Part C — Add your cameras

Back in DailyOffice → Settings → Pack Cam. Each packer picks a camera number in PackStation; here you tell Pack Cam how to reach that camera.

1 Find each camera's IP address

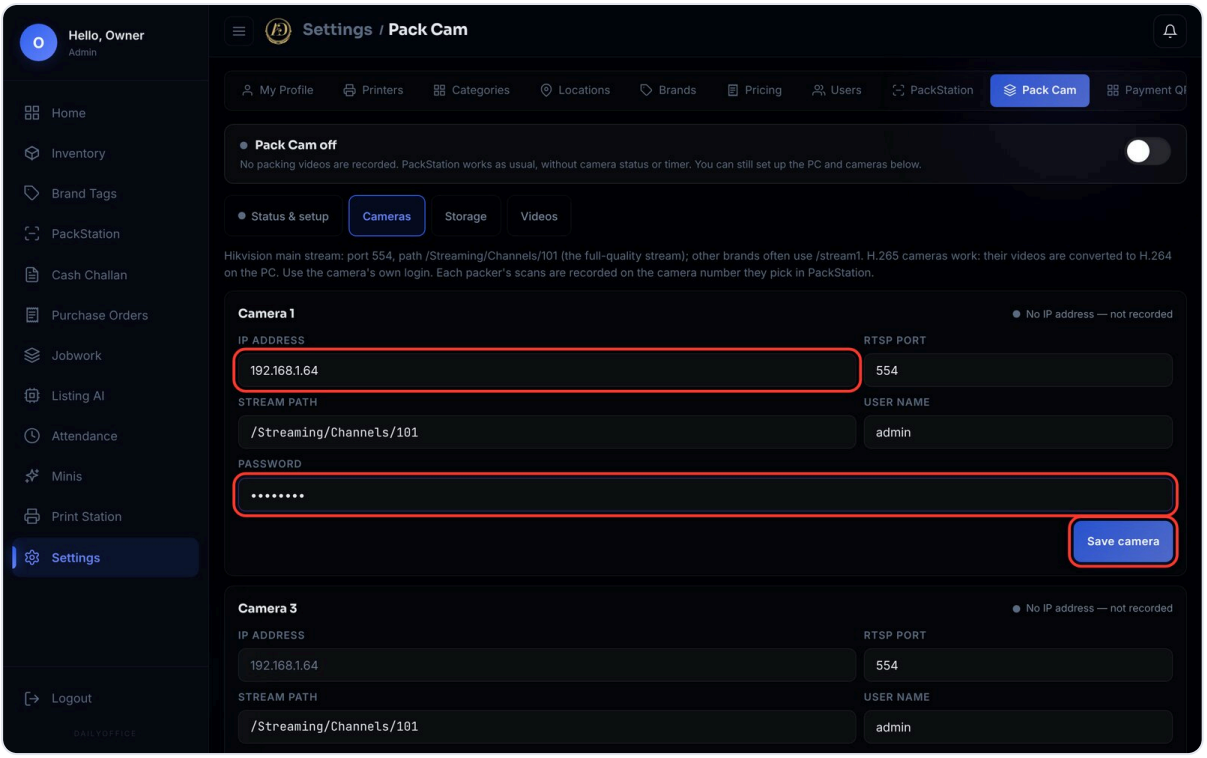

Ask your camera installer, or look in the Hikvision app/recorder. It looks like `192.168.1.64`. Use the camera's own login (usually user name **admin** and the password set at installation).

HOW YOUR CAMERAS ARE CONNECTED	IP ADDRESS TO ENTER	STREAM PATH TO ENTER
Camera plugged into the office network / Wi-Fi router	The camera's own IP	`/Streaming/Channels/101` (already filled in)
Camera plugged into a Hikvision recorder (NVR/DVR)	The **recorder's** IP	Channel number + `01`: camera on channel 1 → `/Streaming/Channels/101`, channel 2 → `/Streaming/Channels/201`, channel 3 → `/Streaming/Channels/301`

> Ask the installer to give each camera (or the recorder) a **fixed IP address**. If it changes, that camera stops recording until you update it here.

2 Fill in each camera and press "Save camera"

Open the **Cameras** tab. For each camera: type the **IP address** and the **password**, check the **stream path** (see the table above), then press **Save camera**.

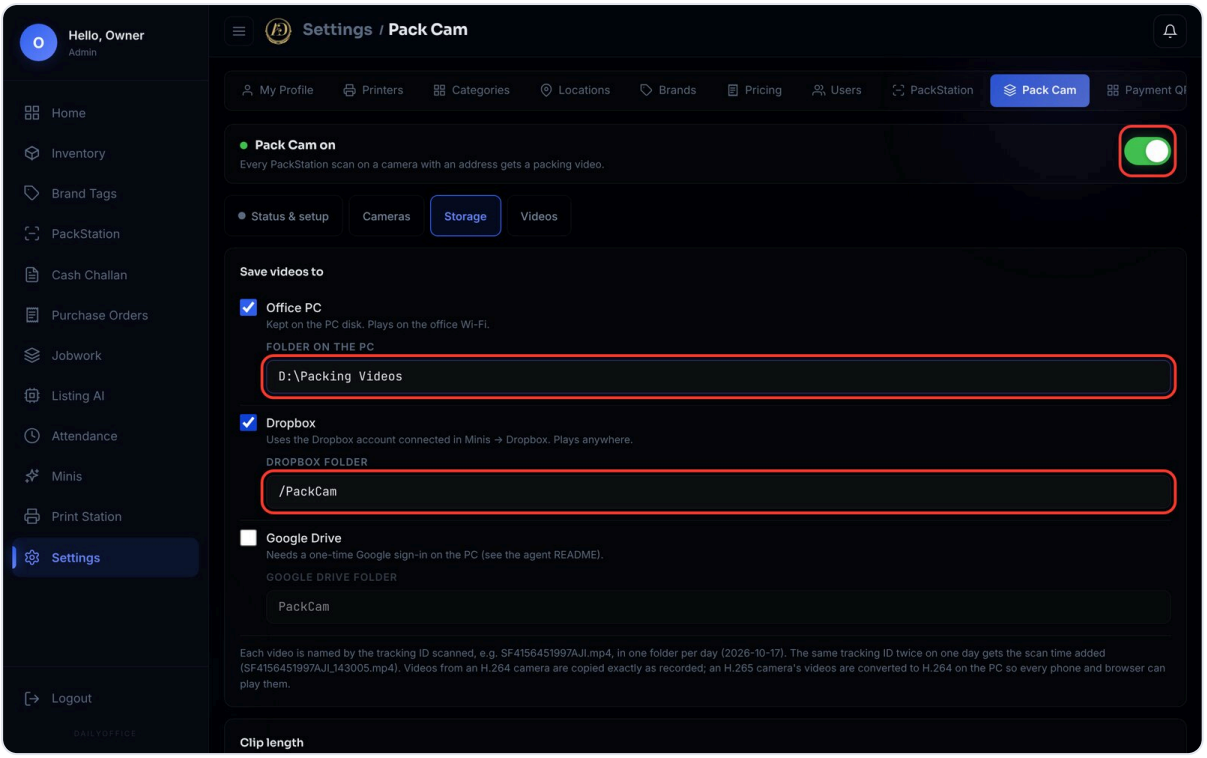

Camera numbers come from Settings → PackStation (the numbers your packers pick). The password is stored safely and is never shown again — to change it, type a new one and save.

Part D — Choose where videos are saved, then turn Pack Cam on

Open the **Storage** tab.

1 Tick where to save, and set each folder

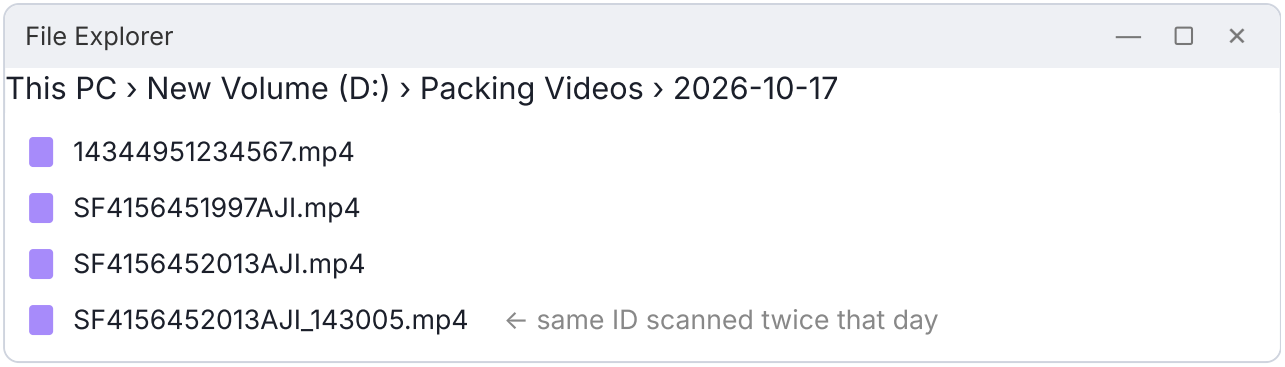

PLACE	WHAT TO TYPE IN ITS FOLDER BOX	GOOD TO KNOW
Office PC	Any folder, e.g. `D:\Packing Videos`. Leave it empty to use `C:\PackCam\clips`.	Plays on phones/computers on the office Wi-Fi. Uses the PC's disk.
Dropbox	A folder starting with **/**, e.g. `/PackCam`	Uses the Dropbox already connected in DailyOffice. Plays anywhere.
Google Drive	A folder name, e.g. `PackCam` or `Packing/Videos`	Needs a one-time Google sign-in on the PC (ask us to help).

You can tick one, two or all three.

2 How the videos are named

Every video is named by the **tracking ID that was scanned**, inside a folder for each day:

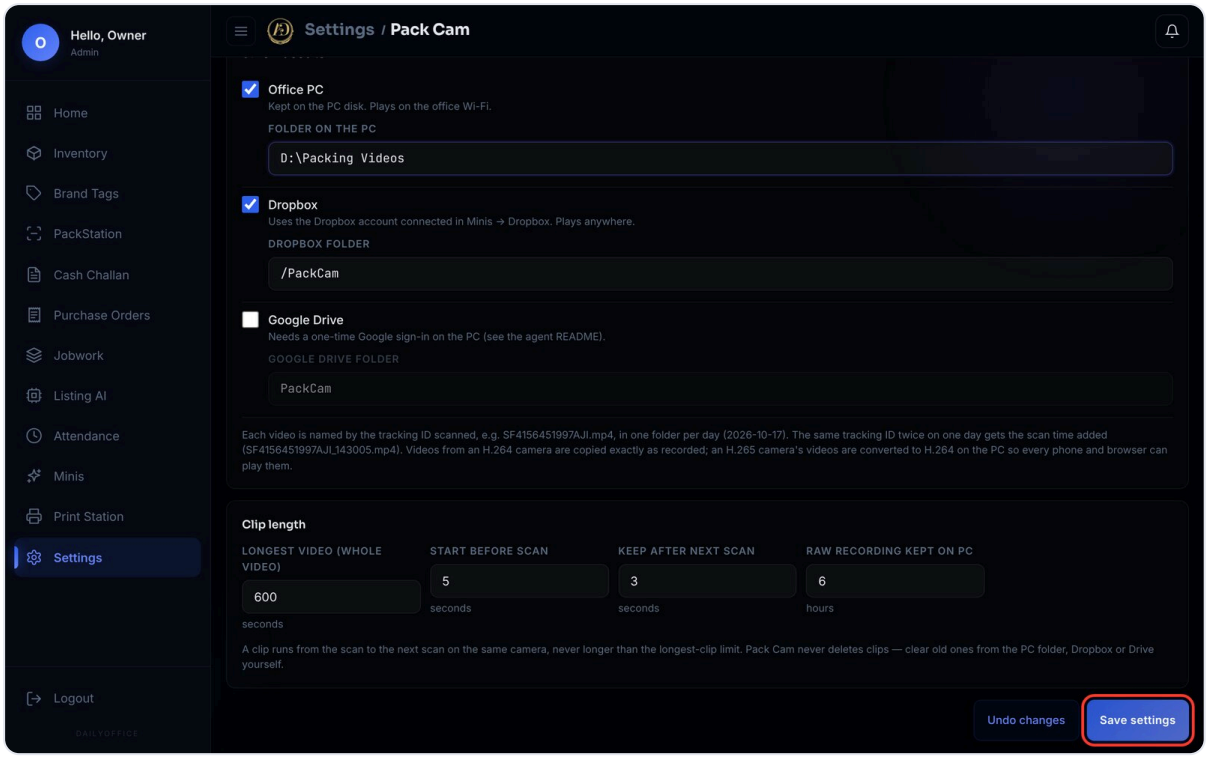

Illustration

To find a parcel's video, open that day's folder and look for its tracking ID (or search the ID in the folder). Videos are saved at the camera's full quality.

3 Turn Pack Cam on and press "Save settings"

Switch on the **Pack Cam** switch at the very top of the page (see the picture in step 1 — it turns on at once), then scroll down and press **Save settings** to keep the places and folders. The same switch turns Pack Cam off when you do not need videos; scans made while it is off simply have no video.

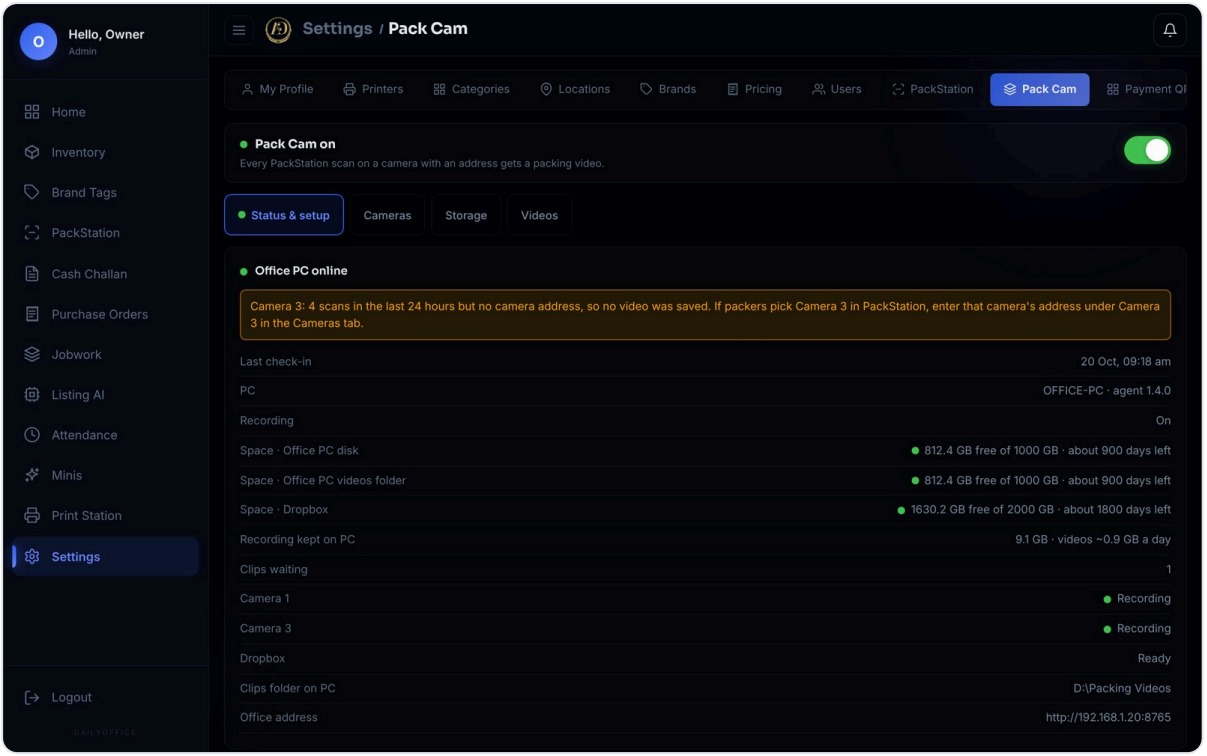

> The other numbers (longest clip, seconds before/after, hours of raw recording) are already set well — you do not need to change them.

Part E — Check that it works

1 Status turns green

Open the **Status & setup** tab. Within a minute it should say **Office PC online**, and every camera should say **Recording**.

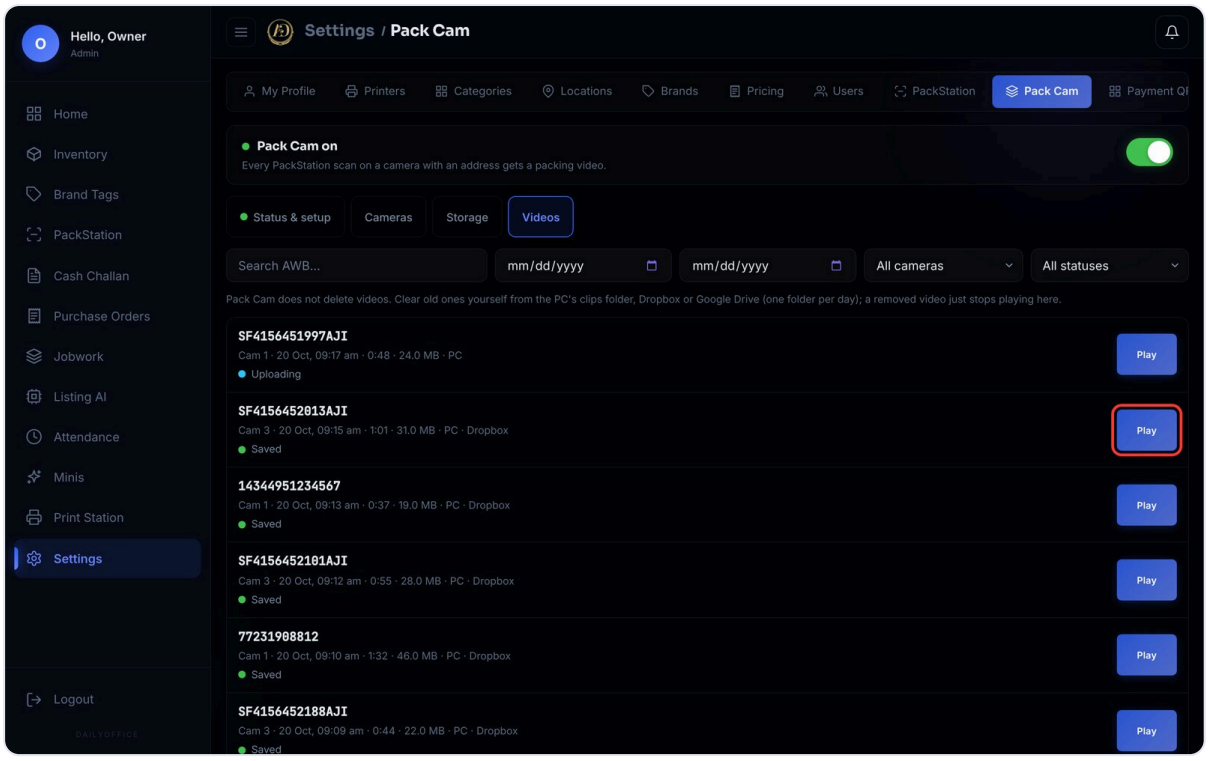

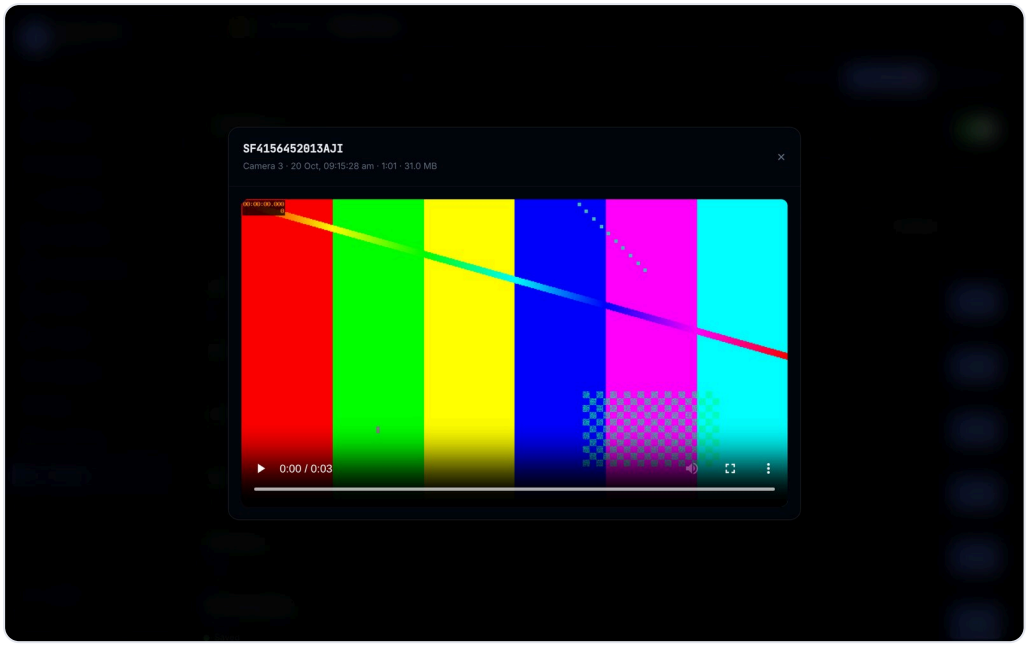

2 Do a test scan

On a phone, open PackStation, pick a camera that is set up, and scan any parcel. Then scan a second parcel on the **same camera**. The first parcel's video is ready about a minute after the second scan (if no second scan comes, after about 10 minutes).

3 See the video in DailyOffice

In Settings → Pack Cam → **Videos** you can search by tracking ID or date. Press **Play** to watch.

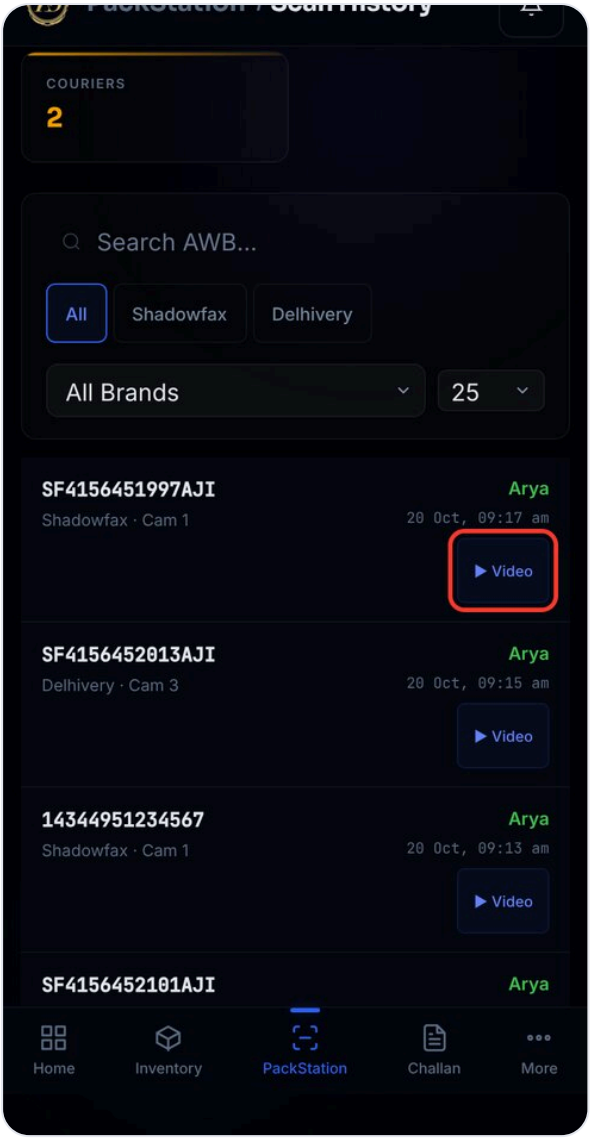

The video player (the picture shown here is a test pattern; yours shows the packing table)

4 Or from PackStation → History

Every scan that has a video shows a ▶ **Video** button.

Done! Pack Cam now runs by itself. Every scan gets its video — nothing more to do each day.

Part F — Daily use, clearing old videos, and problems

Every day

- Nothing to do. Keep the office PC on. Pack an order as usual — scan, pack, scan the next one.
- The video runs from **a packer's scan to that packer's next scan**. So **scan first, then pack** — a parcel scanned after packing gets the next parcel's video. The scan screen reminds packers of this.
- Two packers can share one camera: each one's video runs to their own next scan.
- The scan screen counts down the time left on each parcel's video. It **beeps at 10 seconds**, ticks through the last 5 and sounds when the video stops. For a big parcel, press **+30 s** (it appears in the last 20 seconds) — as many times as needed, up to 10 minutes.
- If the scan screen says **"Pack Cam is switched off"**, no videos are being recorded. If that was a mistake, an admin switches it on again at the top of Settings → Pack Cam.

Clearing old videos (Pack Cam never deletes anything)

- Open the folder (on the PC, in Dropbox or in Google Drive) and delete the **day folders** you no longer need, e.g. `2026-09-01`.
- A video deleted or moved from the PC folder shows **Removed from PC** in DailyOffice within about 10 minutes (a Dropbox / Drive copy still plays).
- Free space on the PC, in Dropbox and in Google Drive is shown in Settings → Pack Cam → Status. When a place is almost full or full, a warning appears there and on the packers' scan screen.

> Each camera keeps recording to the PC for 6 hours as a safety buffer, so a short internet cut does not lose videos — they are saved and uploaded when it comes back.

If something is wrong

YOU SEE	WHAT TO DO
Status says **Office PC offline**	Is the office PC on and signed in (after a power cut, switch it on — Pack Cam starts by itself)? Double-click `start-hidden.vbs` in `C:\PackCam\agent` (nothing visible happens; the status turns green within a minute). If it stays offline, open `startup-errors.log` in that folder. Check the PC's internet.
A camera says **Not recording** or an error	Check the camera has power and network. Check its IP address and password in the Cameras tab (Part C). If the IP changed, type the new one and Save.
Black window shows *"No agent key yet"* or *"Agent key not accepted"*	Press **Create agent key** again (Part A), open `C:\PackCam\key.txt` with Notepad, replace the old key with the new one and save. Pack Cam picks it up by itself within a few seconds.
You want to **update the PC program**	Download **PC program (zip)** again, double-click `stop.bat`, extract the zip to `C:\PackCam` and choose **Replace**, then double-click `start-hidden.vbs`. Your key and settings are kept.
A camera says *"Wrong user name or password"*	Pack Cam stops trying after 2 refusals so the camera does not lock its login. Correct the password in the Cameras tab, press **Save camera**, then **Test connection**.
Dropbox or Google Drive says **Uploads failing**	The videos stay on the PC and are sent again every few minutes. Check that account: is it full, or signed out? For Dropbox, reconnect in Minis → Dropbox.
Status or PackStation says a place is **almost full** or **full**	Delete old videos from that place (PC folder, Dropbox or Google Drive — one folder per day), or get more space. Pack Cam never deletes videos itself.
PackStation History shows **No video · …**	Tap it to read why: Pack Cam was off, the camera had no address, the office PC was offline, the camera was not recording, or the save failed.
A video says **No recording**	The camera was not recording at that time (camera off, network down, or PC off).
Play on a phone says it is **on the office PC** and does not open	That video is kept only on the PC — open it while connected to the **office Wi-Fi**. To watch from anywhere, also tick Dropbox in the Storage tab.
Status shows *"PC folder … cannot be used"*	The folder or drive you typed in Storage does not exist (e.g. drive D: removed). Videos are being saved to `C:\PackCam\clips` meanwhile. Fix the folder in Storage.
Dropbox shows an error or "full"	Free up space in Dropbox, or reconnect Dropbox in Minis → Dropbox.
